IMPROVING PROGRAMS THROUGH SOURCE CODE TRANSFORMATIONS

Dissertation Proposal

Jonathan Dorn

April 19, 2016

Beyond Functional Correctness

- Software development involves ***tradeoffs***.
  - "Fast, good, or cheap. Pick any two."
  - Time vs. memory.
  - Maintainability vs. efficiency.
  - …

LEAGUE of LEGENDS

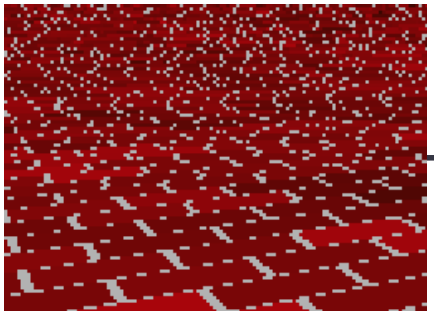
LEAGUE of LEGENDS

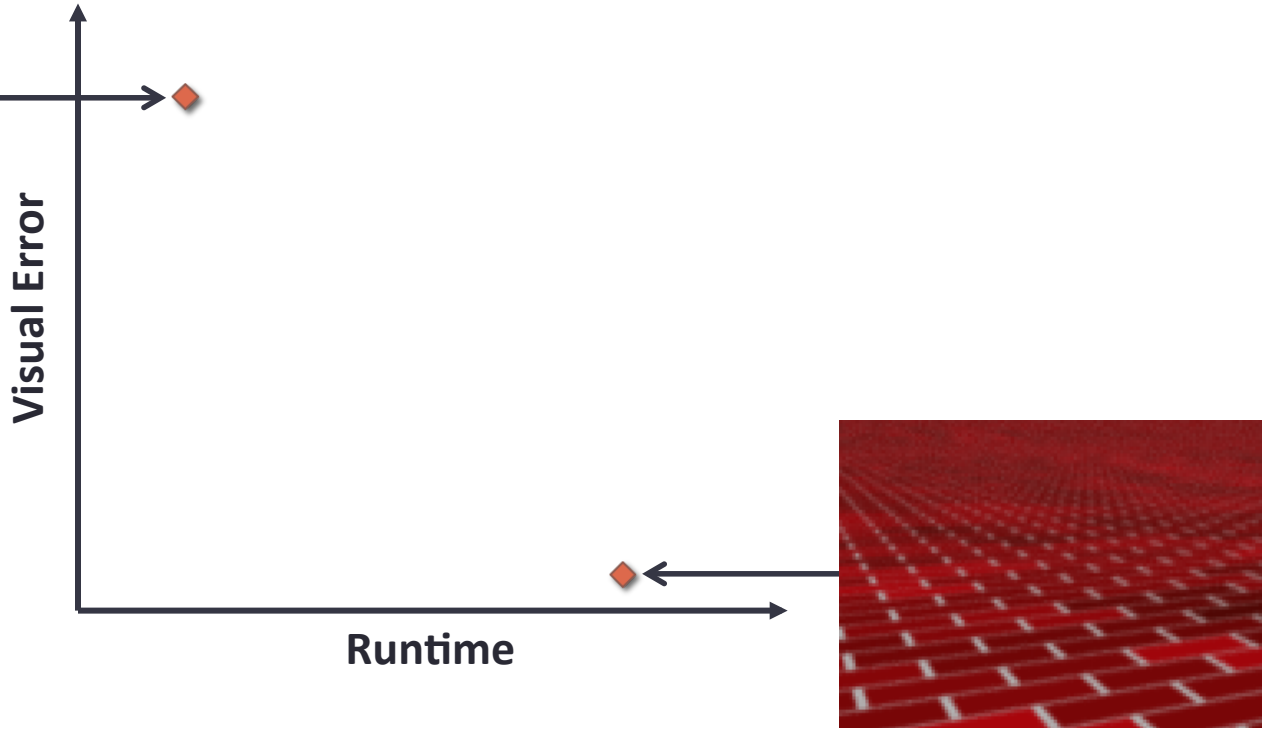
```
552  float Q_rsqrt( float number )
553  {
554          long i;
555          float x2, y;
556          const float threehalfs = 1.5F;
557
558          x2 = number * 0.5F;
559          y  = number;
560          i  = * ( long * ) &y;                                       // evil floating point bit level hacking
561          i  = 0x5f3759df - ( i >> 1 );               // what the ?
562          y  = * ( float * ) &i;
563          y  = y * ( threehalfs - ( x2 * y * y ) );   // 1st iteration
564  //      y  = y * ( threehalfs - ( x2 * y * y ) );   // 2nd iteration, this can be removed
565
566  #ifndef Q3_VM
567  #ifdef __linux__
568          assert( !isnan(y) ); // bk010122 - FPE?
569  #endif
570  #endif
571          return y;
572  }
```

Non-Functional Properties

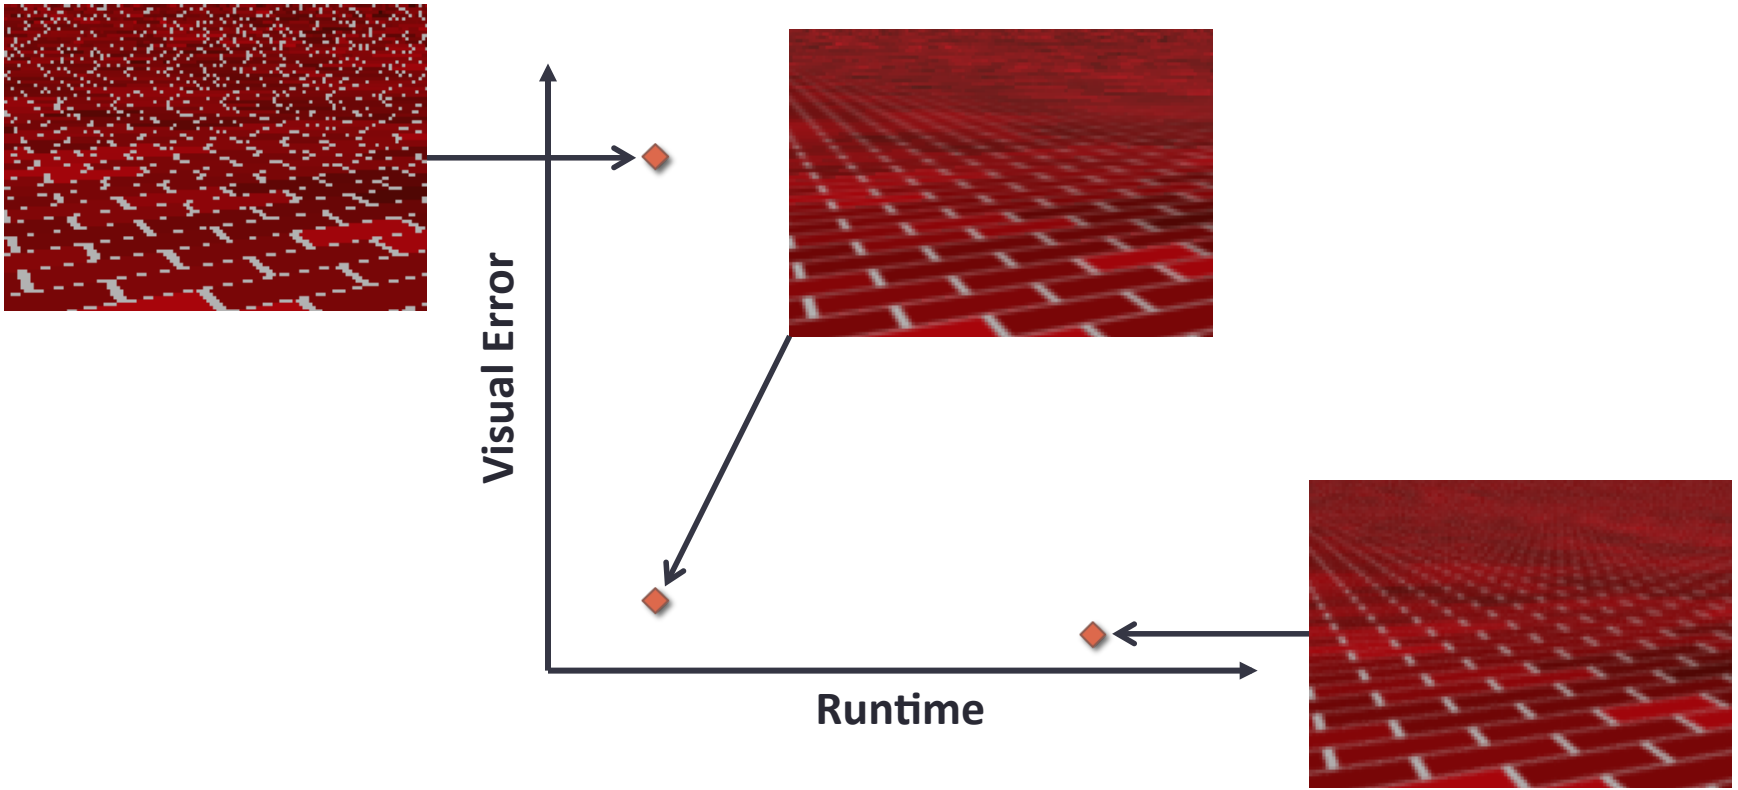
- "***How good***" instead of "***what***" [Paech 2004].
  - "More" or "less;" "higher" or "lower."
- Difficult to reason about (e.g., security).
- Characterize implementations by how much of a property they possess.

Non-Functional Tradeoffs





Non-Functional Tradeoffs



Quantifying Non-Functionality

- Different metrics for different properties.
  - **Image quality**: RGB distance (e.g., L^2), SSIM, EMD.
  - **Runtime**: seconds, speedup/slowdown.
  - **Energy efficiency**: joules, watts.
  - **Maintainability**: bug fix time, defect density.
  - **Correctness**: % error, accuracy, precision, PSNR.

Local Changes

- ***Small*** changes can have ***large*** effects.
  - E.g., `bubble_sort(a)` → `quick_sort(a)`.
- Option of ***fine-grained*** control.
- Program lines, statements, AST nodes.

Proposal Thesis

By applying ***local software transformations***, we can select better tradeoffs between ***non-functional properties*** of existing software artifacts.

The rest of this proposal

Computer Generated Imagery

- 11% of all tickets in 2015 went to computer animated movies.*
  - Does not include live movies with CGI.
- Video games topped $90B in 2015.**

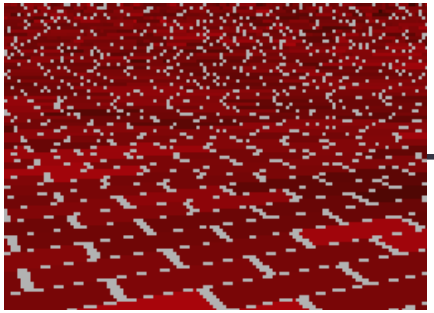
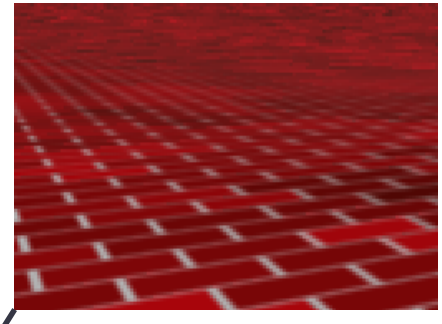
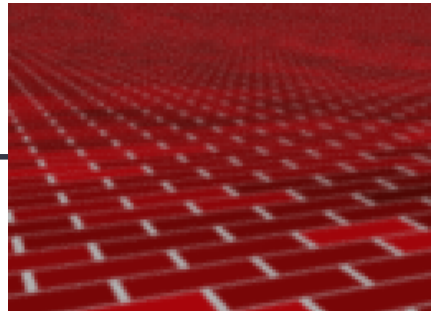
Visual Error and Runtime Performance



Original Program



Desired Program

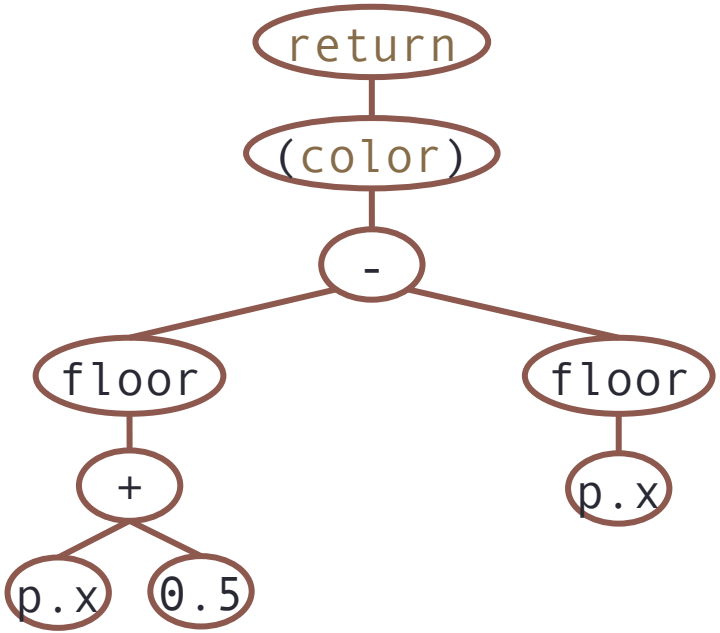


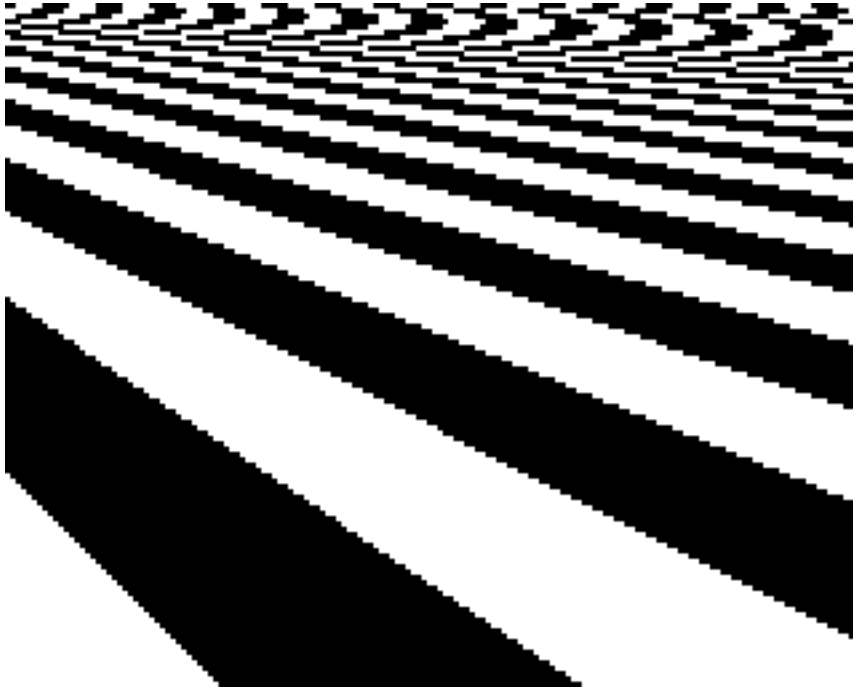
Existing Technique

Hypothesis

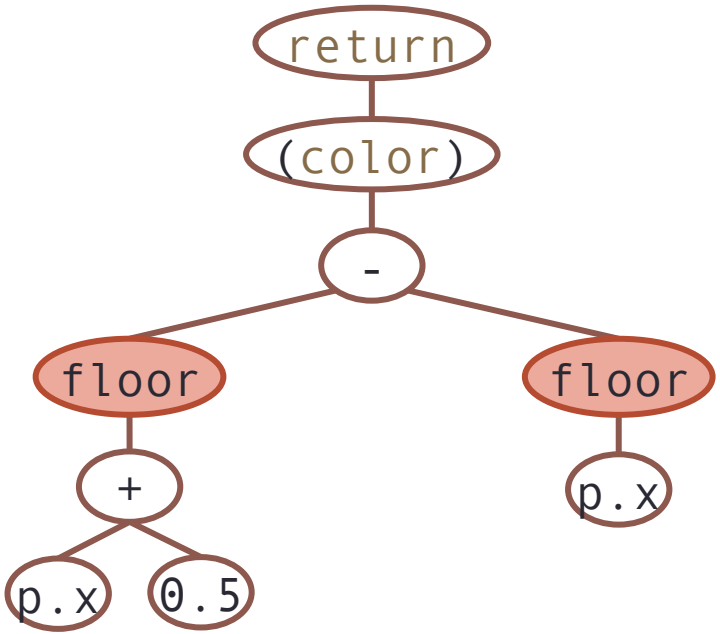
- We can apply local changes to the abstract syntax tree of a graphics program to produce an approximation that is:
  - ***Visually faithful*** to the original and
  - ***Efficient*** to compute.
- Evaluate both image quality and runtime.

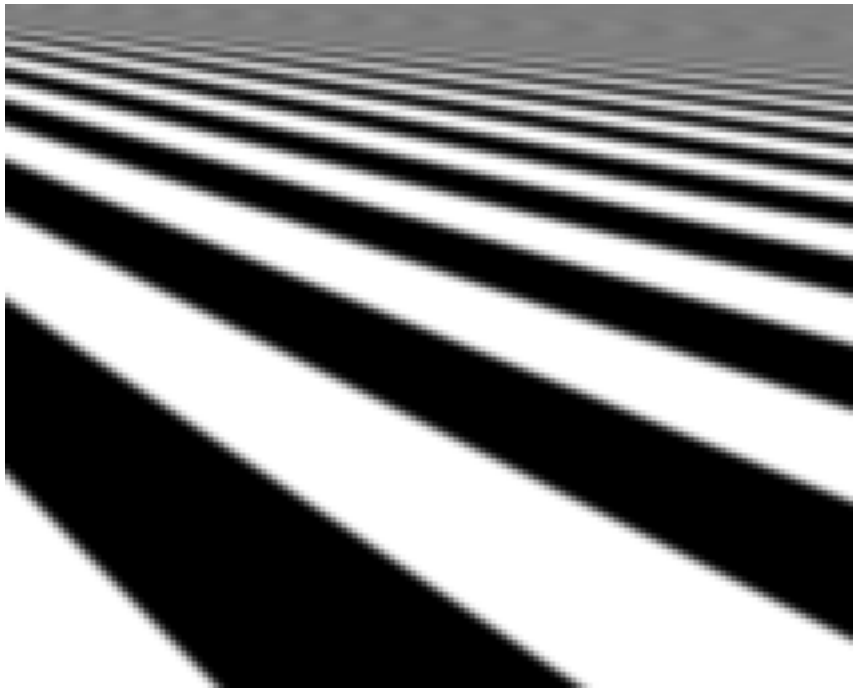
Simple Example



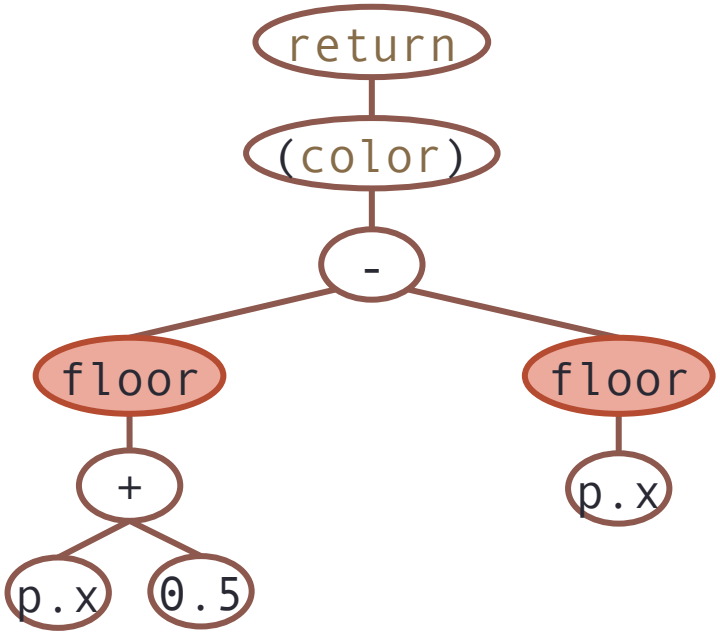


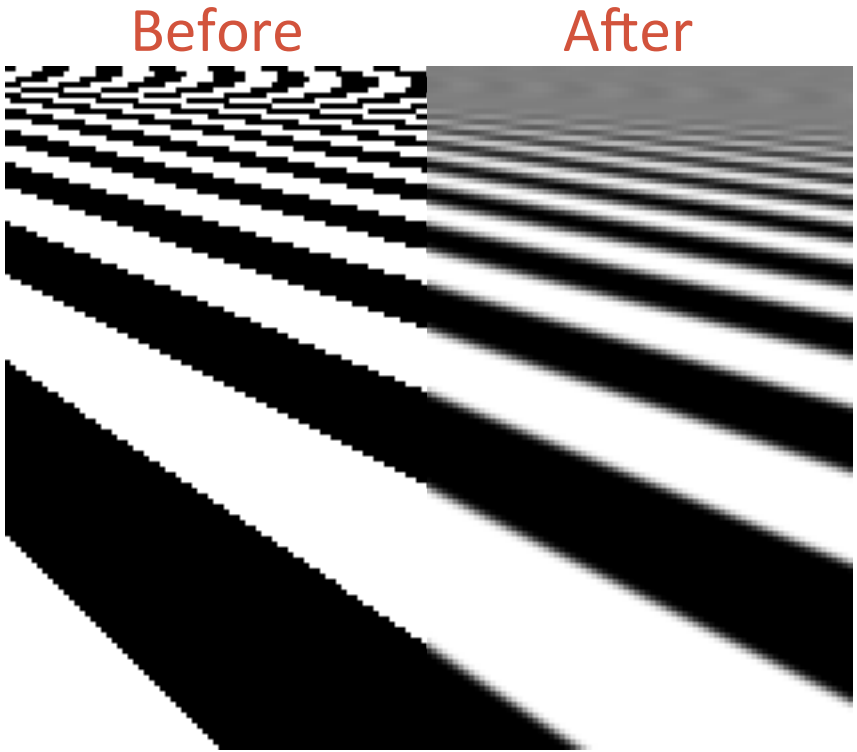
Simple Example





Simple Example





Approach

- Transformation: Replace node N with N’.
- Determine replacements offline (manual).
- Genetic search to select nodes to replace.
  - Use image quality as fitness function.

Experimental Setup

- Benchmarks chosen from previous work.
- Record ***runtime*** and ***image quality***.
- Three data points for each benchmark:
  1. Original program.
  2. Baseline “slower but less error” approach.
  3. Best transformed variant from our search.

Runtime Results

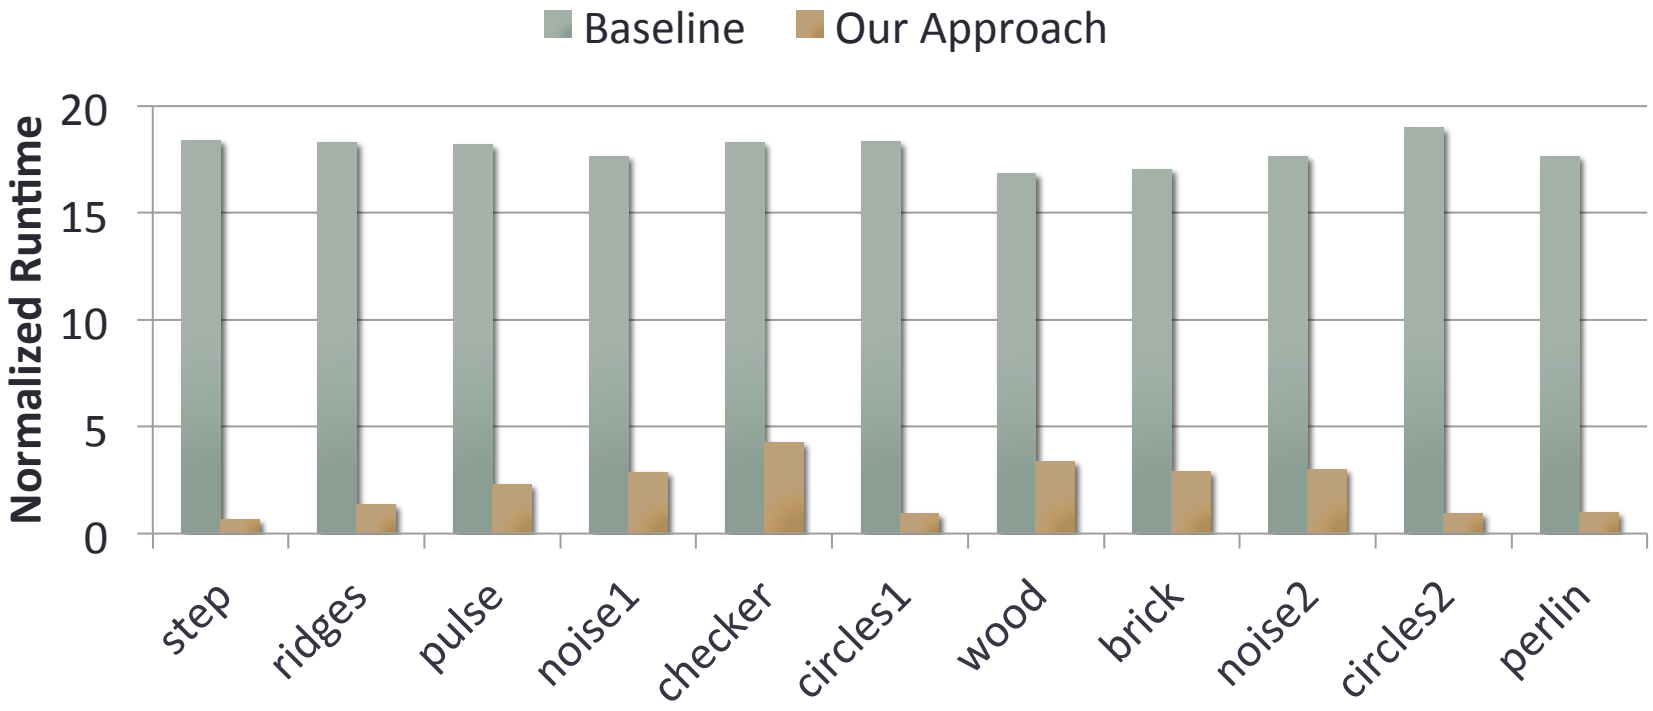


Image Quality Results

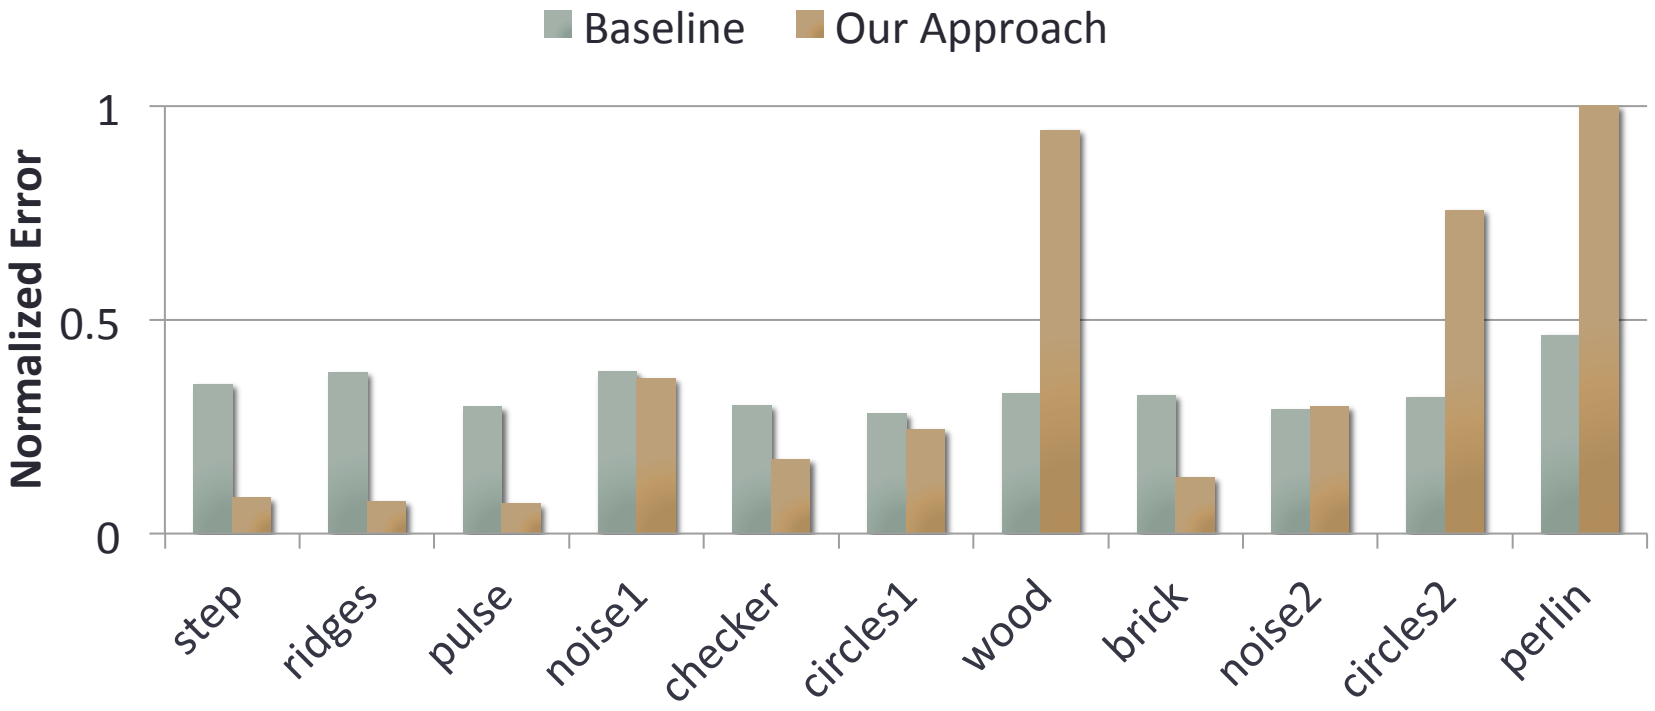


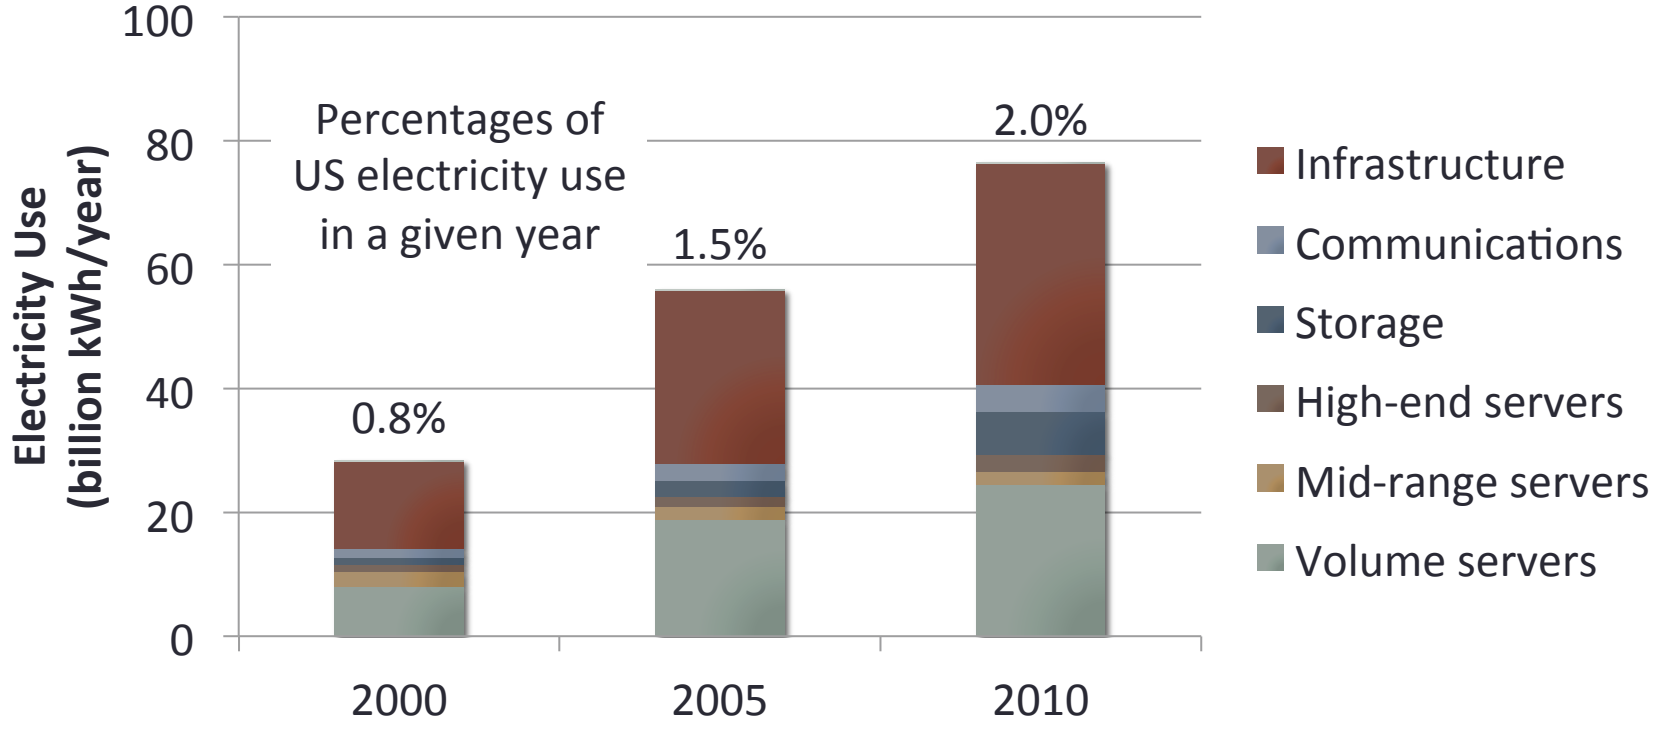
Summary

- We can apply local changes to produce programs that:
  - Are significantly ***faster*** than the baseline approach,
  - Have ***less error*** than the original program, and
  - Often have ***less error*** than the baseline.

Outline

- Overview of the proposed research thrusts
  - Visual error and runtime performance
  - Energy usage
  - Coding style
- Proposed research timeline
- Conclusion

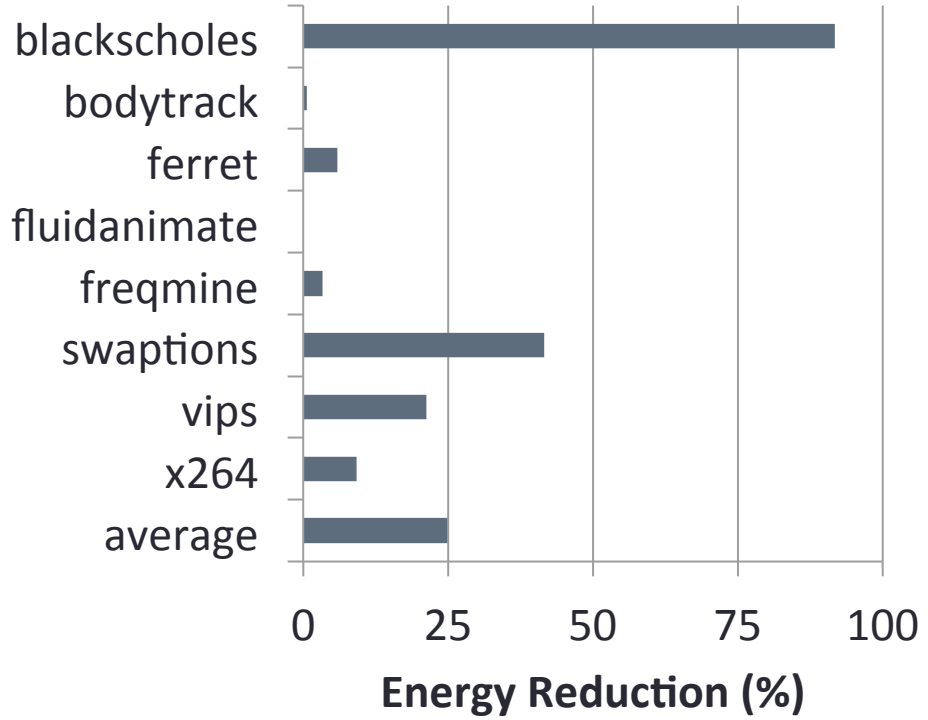
Data Center Energy Use



Reproduced from J. Koomey. *Growth in data center electricity use 2005 to 2010*. Analytics Press, Oakland, CA, 2011.

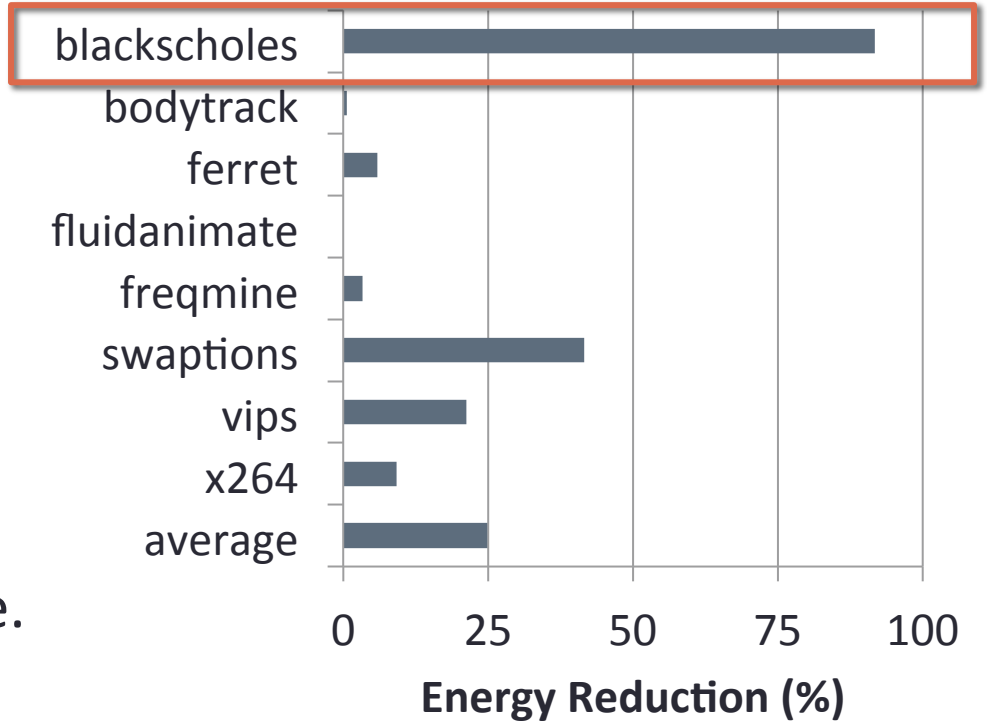
Genetic Optimization Algorithm

- Local changes to assembly code.
- Tradeoff between ***reduced energy*** and ***relaxed semantics***.
  - Validated with test suite.

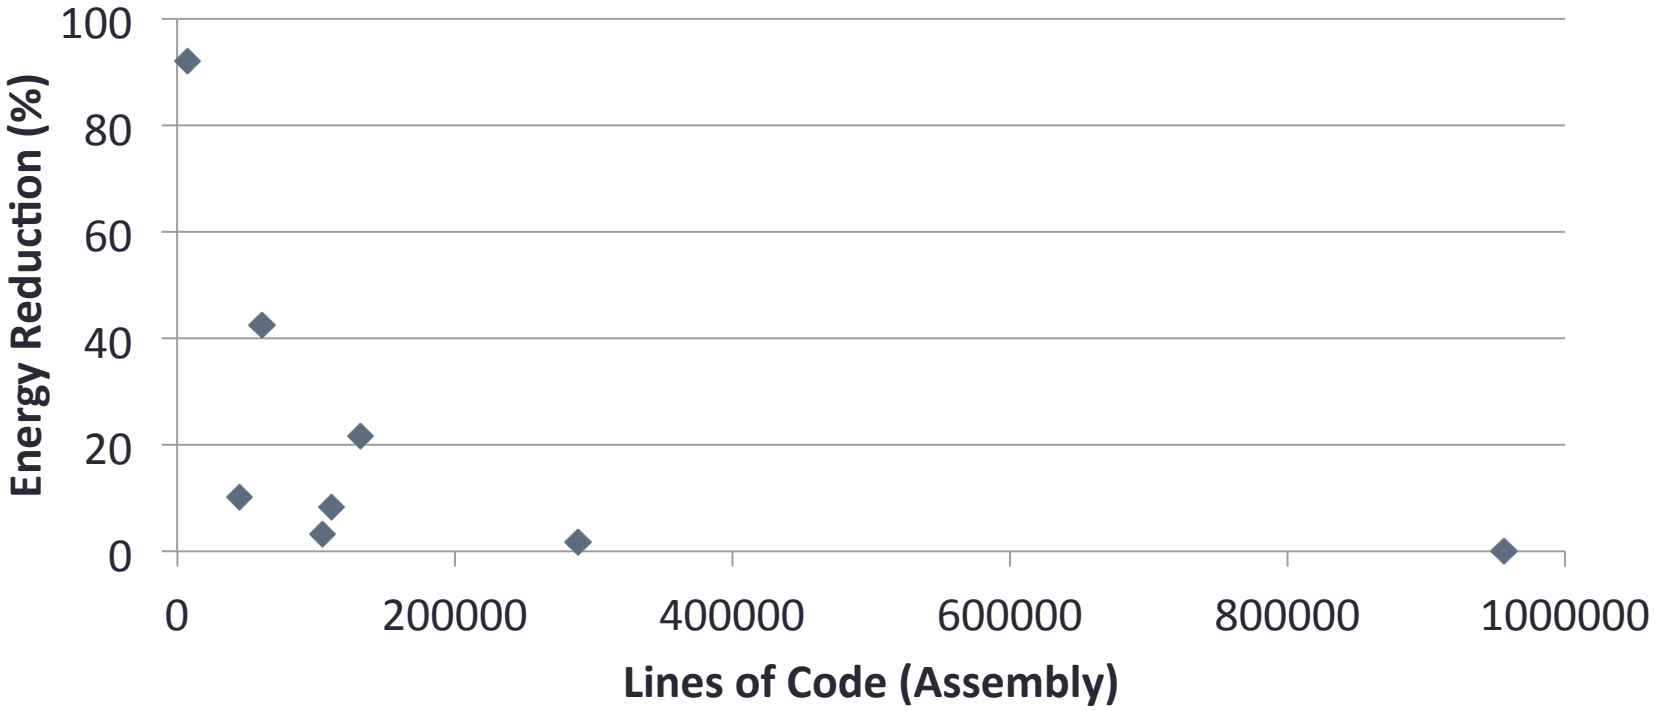


Genetic Optimization Algorithm

- Local changes to assembly code.
- Tradeoff between ***reduced energy*** and ***relaxed semantics***.
  - Validated with test suite.



Scaling to Larger Programs



Hypothesis

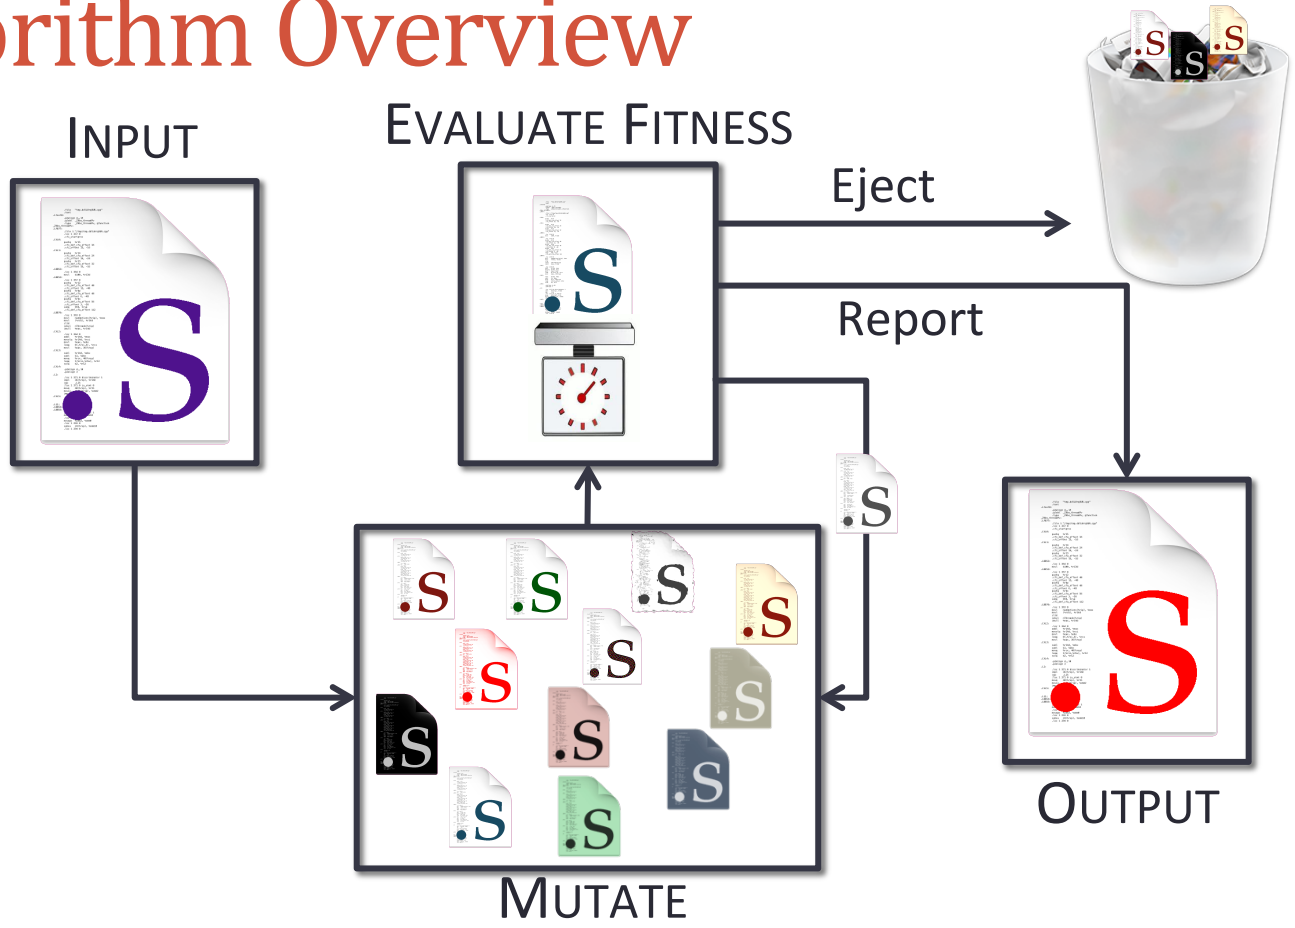
By directing the genetic search more effectively and ***reducing*** the search space, we can achieve ***larger*** energy optimizations ***faster***.

Evaluate both magnitude of optimization and search time.

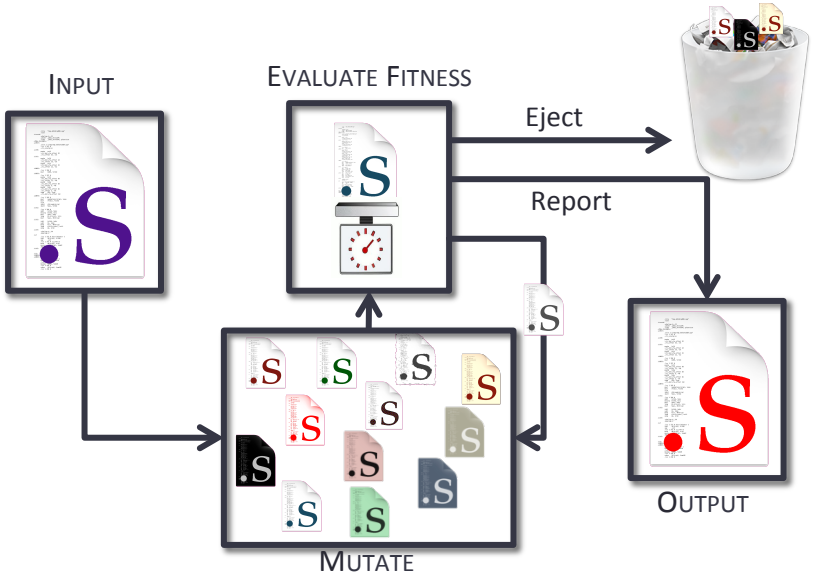
Intuition

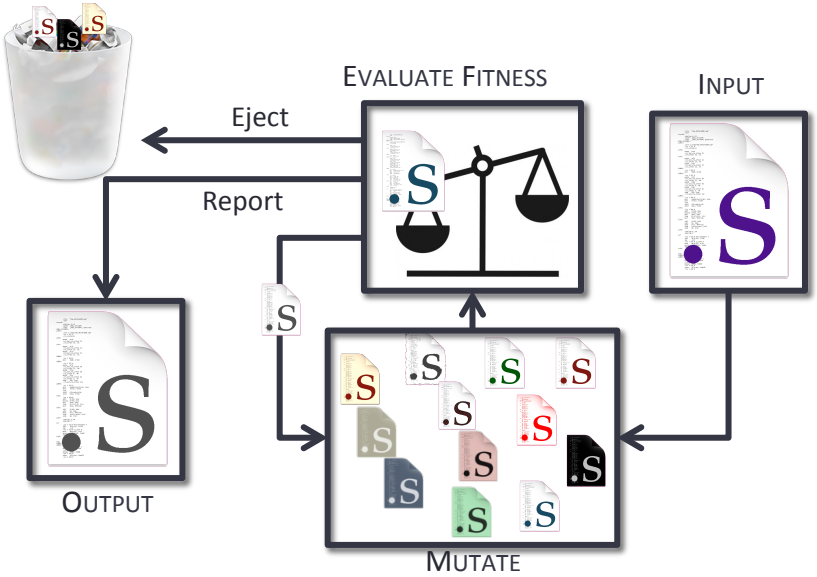
- Optimizations on different paths through the program are likely to be independent.
  - ***Combine*** optimizations from separate searches.
- Optimizations on frequently executed paths are likely to have larger impact.
  - ***Profile*** the program to target hot paths.

Algorithm Overview

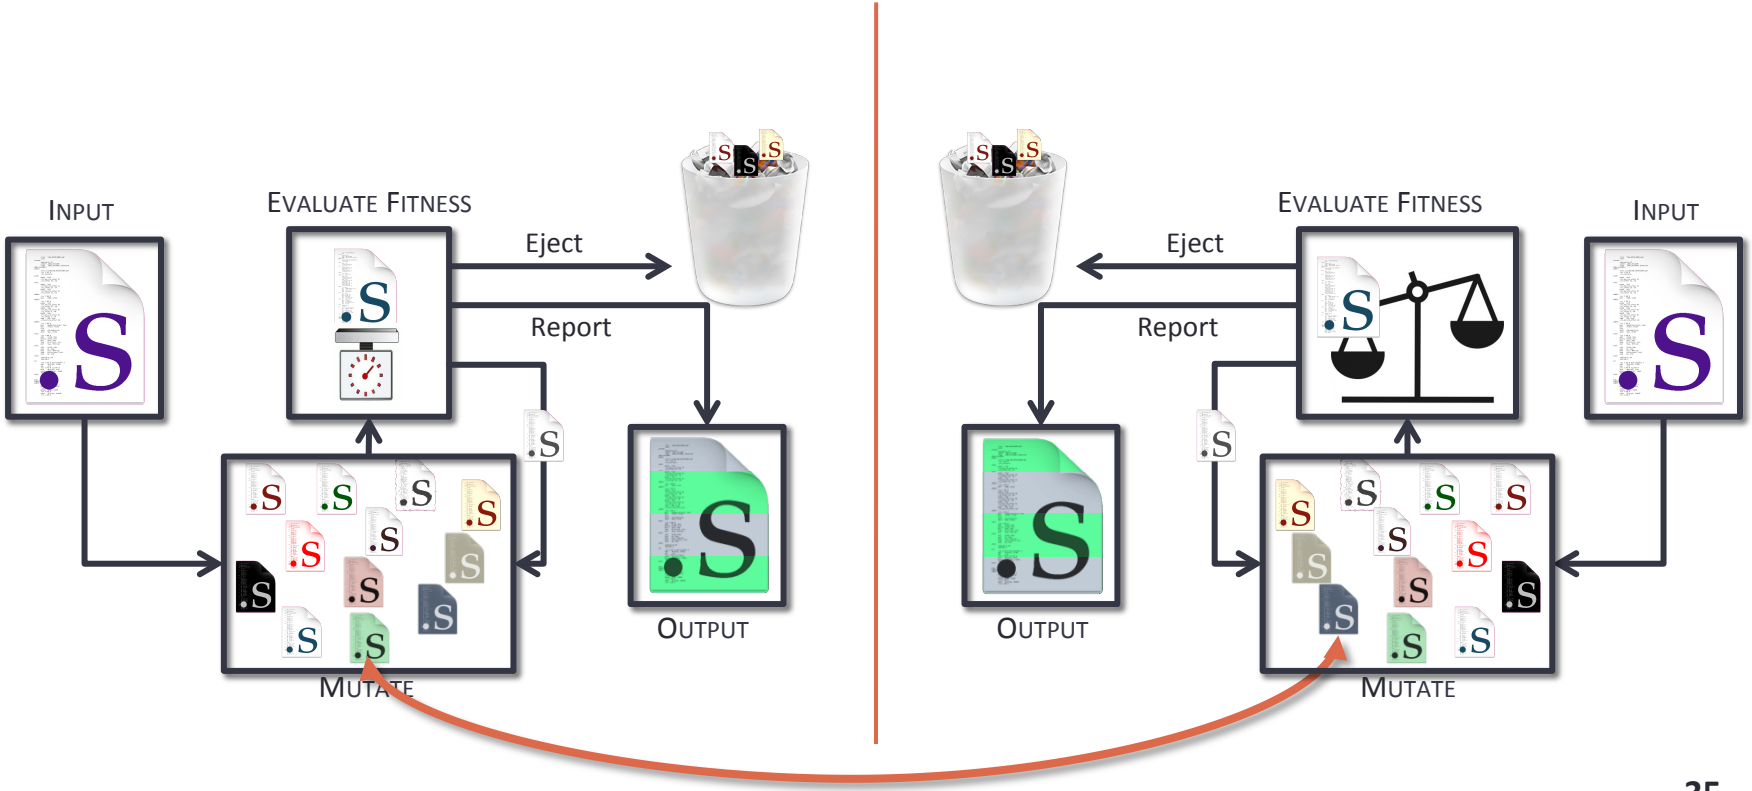


Optimizing Two Workloads

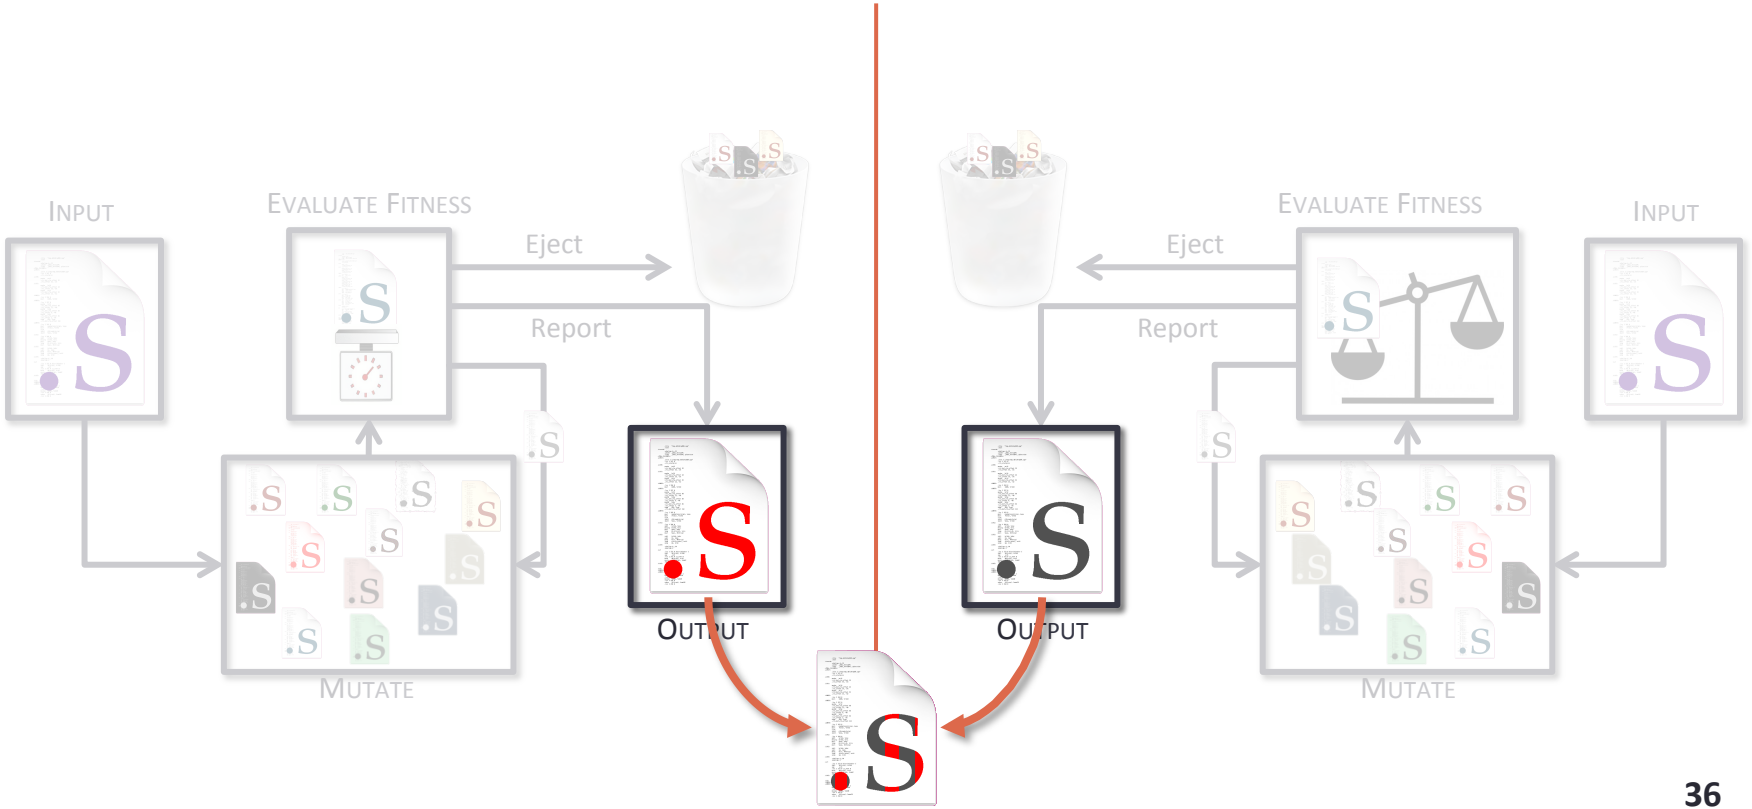




Option 1: Share Variants During Search



Option 2: Combine Best After Search



Experimental Setup

Benchmarks

- Collect HPC and data center benchmarks.
- Collect multiple workloads for each benchmark.

Baseline: GOA search

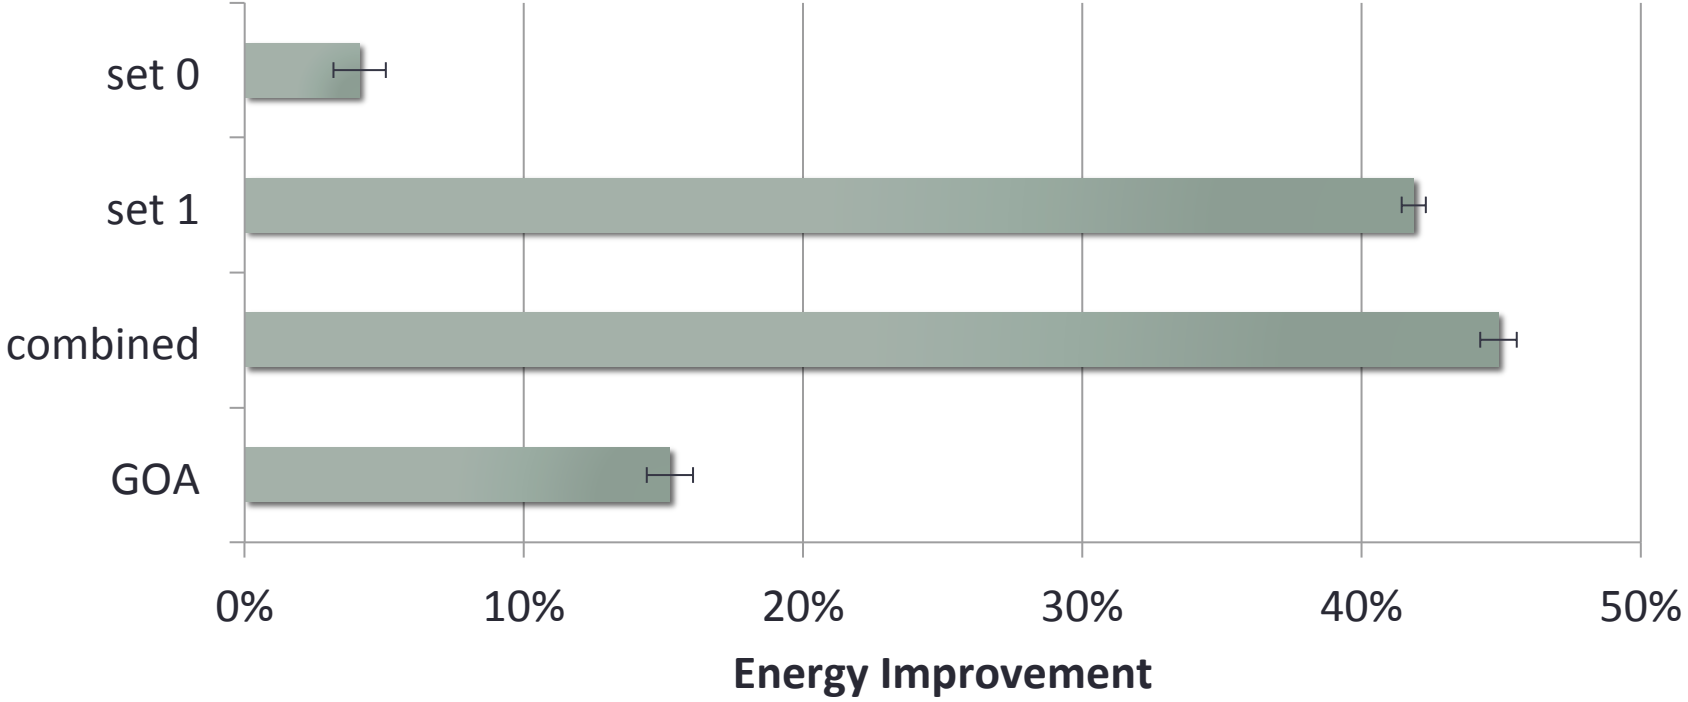
1. Only one workload.
2. All workloads in single fitness function.

Metrics for Energy Optimization

- ***Energy*** measured at the wall.
- ***Wall time*** before best variant.
  - Latest best variant if combining after search.
- ***Fitness evaluations*** before best variant.

- Success if searching separately produces larger energy reduction across all workloads.

Preliminary Results

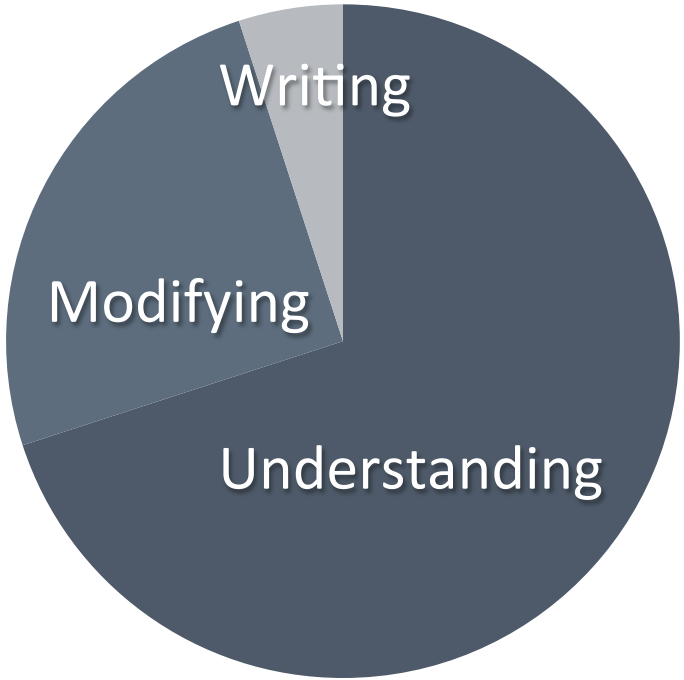


Outline

- Overview of the proposed research thrusts
  - Visual error and runtime performance
  - Energy usage
  - Coding style
- Proposed research timeline
- Conclusion

Programmer Time

- Programmer salaries in the U.S. exceed $100B.
- Programmers spend ***much more*** time reading code than writing it.



Reproduced from P. Hallam. What do programmers really do anyway? (aka part 2 of the yardstick saga). http: //blogs.msdn.com/b/peterhal/archive/2006/01/04/509302.aspx. Accessed: 2016-02-01.

Stylish Code

- ***Broad consensus*** for standardized coding style.
- ***Persistent disagreement*** on specifics.
  - E.g., tabs vs. spaces.
- "Every major open source project has its own style guide." – Google's style guide.

Beacons

- Indicate likely structure or functionality.
- Semantic or syntactic.
- May vary
  - Between programmers,
  - And over time.

```
for (i=0; i<n; i++) {
  for (j=0; j<n; j++) {
    …
    temp = a[i];
    a[i] = a[j];
    a[j] = temp;
    …
  }
}
```

Beacons

- Indicate likely structure or functionality.
- Semantic or syntactic.
- May vary
  - Between programmers
  - And over time.

```
for (i=0; i<n; i++) {
  for (j=0; j<n; j++) {
    …
    temp = a[i];
    a[i] = a[j];
    a[j] = temp;
    …
  }
}
```

Possible sort Implementation?

Beacons

- Indicate likely structure or functionality.
- Semantic or syntactic.
- May vary
  - Between programmers,
  - And over time.

```
for (i=0; i<n; i++) {
  for (j=0; j<n; j++) {
    …
    temp = a[i];
    a[i] = a[j];
    a[j] = temp;
    …
  }
}
```

End of scope.

Classification of Coding Style

- Typographic and Structural [Oman 1988].
  - Typographic: whitespace, line length, identifier length, layout.
  - Structural: modularity, level of nesting, control and information flow.

Classification of Coding Style

- Typographic and Structural [Oman 1988].
  - Typographic: whitespace, line length, identifier length, layout.
  - Structural: modularity, level of nesting, control and information flow.

Hypothesis

- We can apply local changes to the typographic elements of source code to
  - Match a programmer's expected style and
  - ***Improve*** their understanding of the code.

- Evaluate time and accuracy on tests of understanding.

Modeling Typographic Style

- *N*-gram language model.
  - Uses previous *n*-1 tokens to predict next token.
  - Learn probabilities from existing code.
  - NATURALIZE framework [Allamanis 2014].
  - Can predict or suggest whitespace.

Similarity of Typographic Style

- Measure similarity of *N*-gram models.
  - *N*-gram models are probability distributions.
- Measure similarity of style-checker rules.
  - Allamanis et al. generate rules from *n*-gram models.

Experimental Setup

Benchmarks

1. Reformat the same code in different ways.
2. Collect similar code from different authors (e.g., textbook examples).

Participants

- Undergraduate student volunteers from upper level electives.
- Amazon Mechanical Turk workers who pass a screening test.

Human Study

1. Identify written style.
   - Participants write code to accomplish simple tasks.
   - E.g., check that a list is sorted.
2. Perform maintenance tasks.
   - Participants answer questions about code examples.
   - E.g., what is the value of x on line 5?

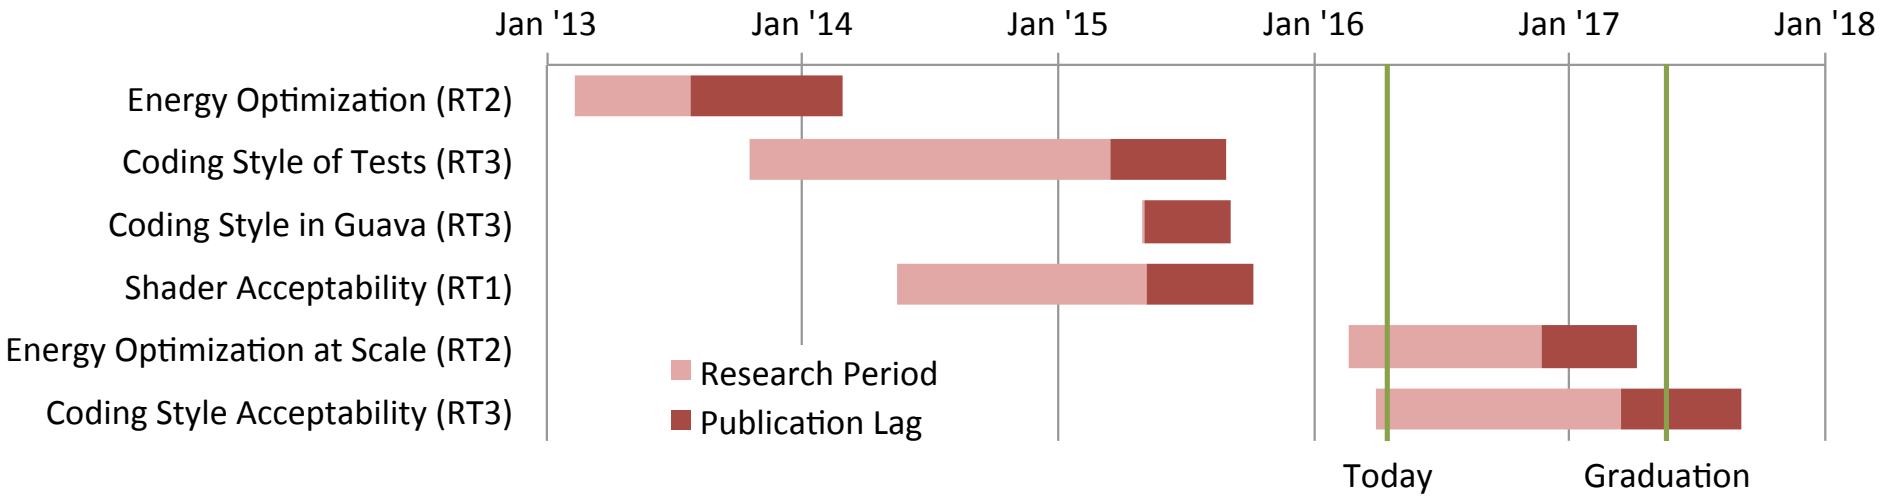
Metrics for Program Understanding

- Collect ***similarity*** between code participants wrote and the code samples.
- Collect ***time*** and ***accuracy*** in answering questions.
- Measure correlation between similarity and time and between similarity and accuracy.

Outline

- Overview of the proposed research thrusts
  - Visual error and runtime performance
  - Energy usage
  - Coding style
- Proposed research timeline
- Conclusion

Research Timeline



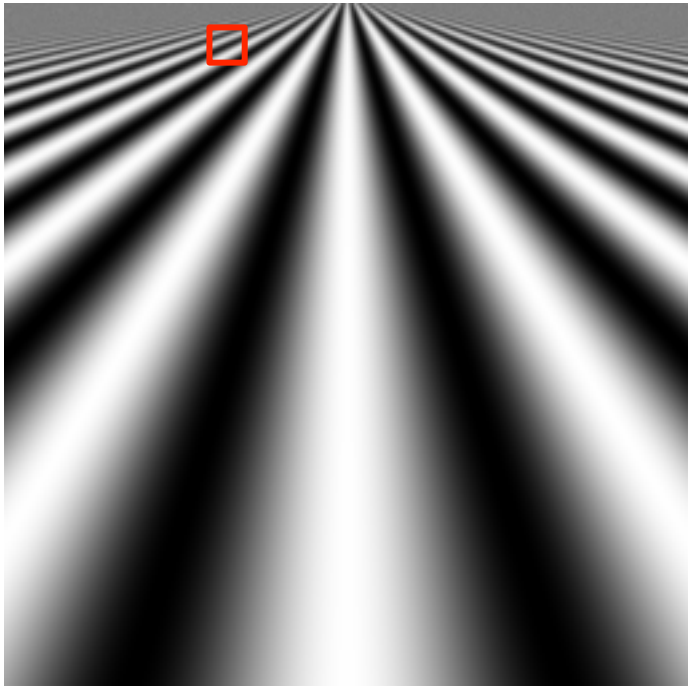
Conclusion

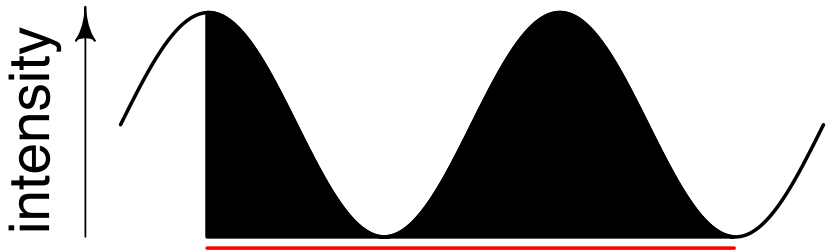
Enable better tradeoffs between non-functional properties through local software transformations.

1. Visual error and runtime performance.
2. Energy usage.
3. Coding style.

BACKUP

The Rendering Equation (simplified)





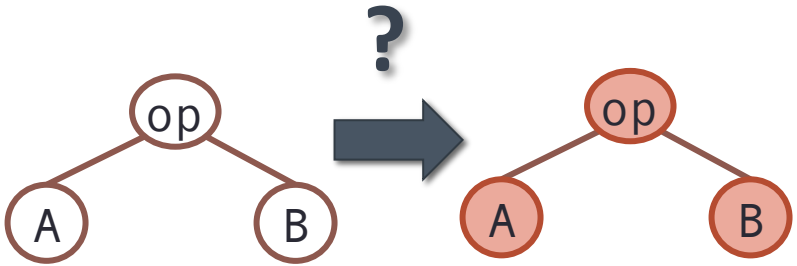
$$\int_P I(p)\cos(p)\,k(p,w)\,dp$$

Graphics Primitives

- Substitutions for built-in expressions.
- Assuming locally uniform lighting and Gaussian pixels.

$f(x)$	$\hat{f}(x,w)$
x	x
x^2	x^2+w^2
$fract_1(x)$	$\frac{1}{2}-\sum_{n=1}^{\infty}\frac{\sin(2\pi nx)}{\pi n}e^{-2w^2\pi^2n^2}$
$fract_2(x)$	$\frac{1}{2w}\left(fract^2\left(x+\frac{w}{2}\right)+\left\lfloor x+\frac{w}{2}\right\rfloor-fract^2\left(x-\frac{w}{2}\right)-\left\lfloor x-\frac{w}{2}\right\rfloor\right)$
$fract_3(x)$	$\frac{1}{12w^2}\left(f'(x-w)+f'(x+w)-2f'(x)\right)$ where $f'(t)=3t^2+2fract^3(t)-3fract^2(t)+fract(t)-t$
$\lvert x\rvert$	$x\,\mathrm{erf}\frac{x}{w\sqrt{2}}+w\sqrt{\frac{2}{\pi}}e^{-\frac{x^2}{2w^2}}$
$\lfloor x\rfloor$	$x-\widehat{fract}(x,w)$
$\lceil x\rceil$	$\widehat{floor}(x,w)+1$
$\cos x$	$\cos x\,e^{-\frac{w^2}{2}}$
$saturate(x)$	$\frac{1}{2}\left(x\,\mathrm{erf}\frac{x}{w\sqrt{2}}-(x-1)\,\mathrm{erf}\frac{x-1}{w\sqrt{2}}+w\sqrt{\frac{2}{\pi}}\left(e^{-\frac{x^2}{2w^2}}-e^{-\frac{(x-1)^2}{2w^2}}\right)+1\right)$
$\sin x$	$\sin x\,e^{-\frac{w^2}{2}}$
$step(a,x)$	$\frac{1}{2}\left(1+\mathrm{erf}\frac{x-a}{w\sqrt{2}}\right)$
$trunc(x)$	$\widehat{floor}(x,w)-\widehat{step}(x,w)+1$

Correctness of Composition

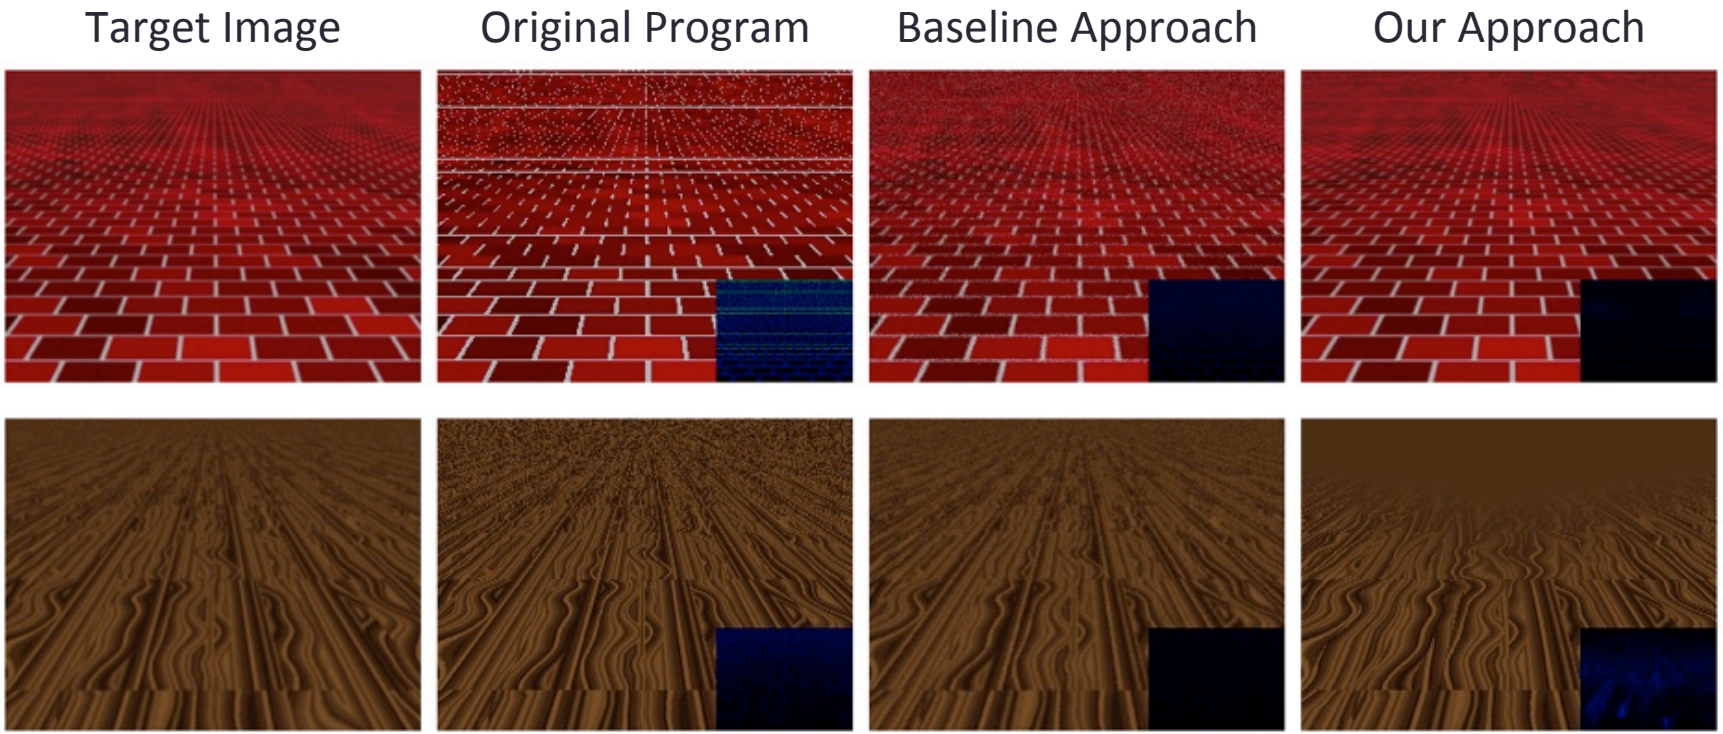


- If “A” and “B” are constants.
- If “op” is addition or subtraction.
- If “op” is multiplication and “A” and “B” are multiplicatively separable.

Graphics Benchmarks

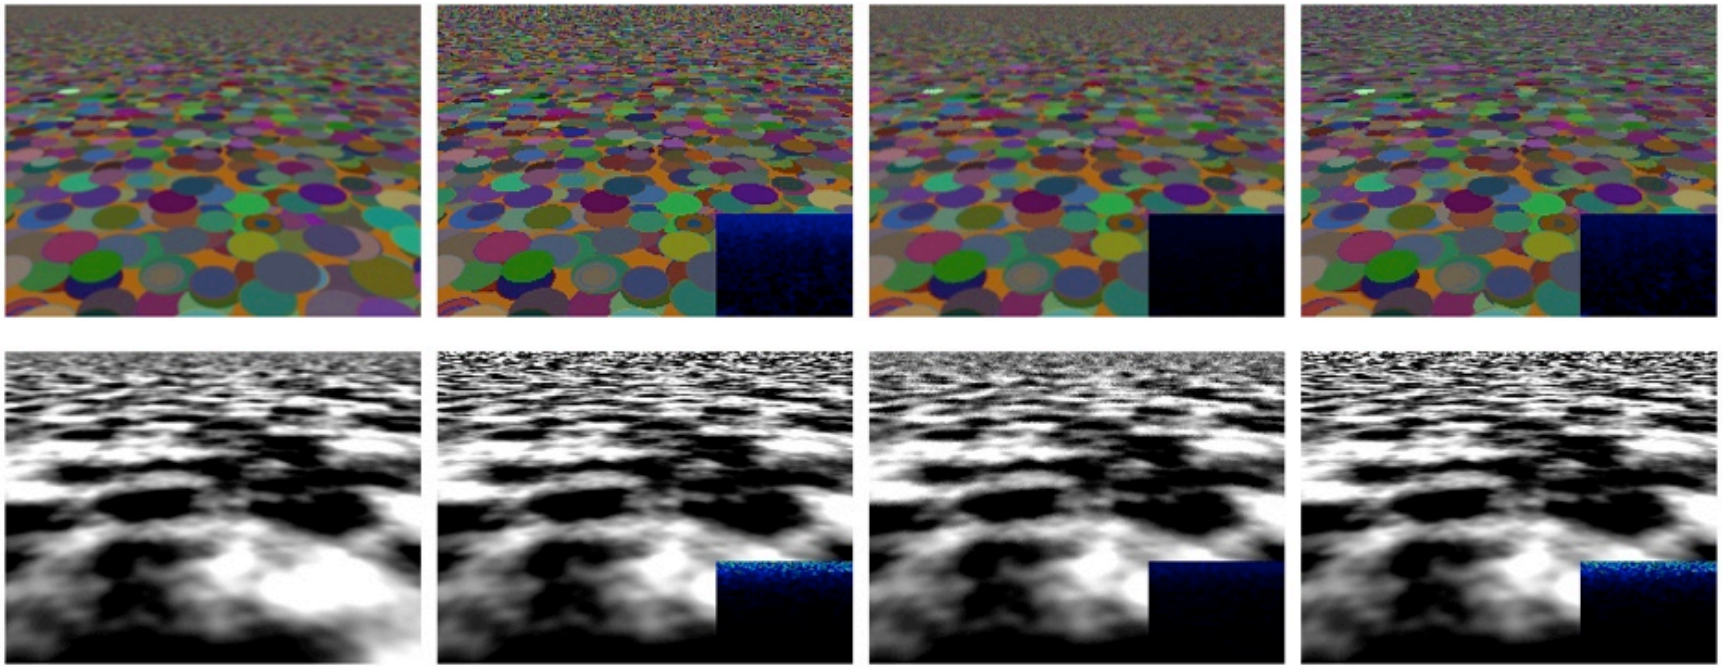
Benchmark	Nodes	Description
step	1	Black and white plane
ridges	1	fract(x)
pulse	2	Black and white stripes
noise1	3	Super-imposed noise
checker	4	Checkerboard
circles1	5	Tiled circles
wood	18	Wood grain
brick	26	Brick wall
noise2	28	Color-mapped noise
circles2	74	Overlapping circles
perlin	244	Improved Perlin noise

Results: Brick and Wood



Results: More Complex Procedures

Target Image | Original Program | Baseline Approach | Our Approach



Execution Profiles

- Dynamic profiles:
  - Run workload, sample program counter periodically, estimate probability distribution.
- Static profiles:
  - Estimate distribution directly from code.
- Select lines to mutate from distribution.

Updating Profiles

- Some mutations may change the profile.
  - E.g., remove a hot path.
- Can we update the profile without starting from scratch?

Does Coding Style Matter?

```
IF       A>B         THEN S := 1;
IF (A=B) AND (C>D)   THEN S := 2;
IF (A=B) AND (C<=D) THEN S := 3;
IF (A<B) AND (C>D)   THEN S := 4;
IF (A<B) AND (C=D)   THEN S := 5;
IF (A<B) AND (C<D)   THEN S := 6;
```

```
IF A > B THEN
 S := 1
ELSE IF A = B THEN
 IF C > D THEN
  S := 2
 ELSE
  S := 3
ELSE IF C > D THEN
 S := 4
ELSE IF C = D THEN
 S := 5
ELSE
 S := 6;
```

Reproduced from P. W. Oman and C. R. Cook.
A paradigm for programming style research. *ACM Sigplan Notices*, 23(12):69–78, 1988.

A paradigm for programming style research. *ACM Sigplan Notices*, 23(12):69–78, 1988.

N-gram Models for Coding Style

```
void <space>1 main ( void ) <space>1 { <newline>
<indent>2 printf ( “hello world\n” ) ; <newline>
} <newline>
```

$$P(\langle \text{indent}_2 \rangle |) \langle \text{space}_1 \rangle \{ \langle \text{newline} \rangle)$$

Evaluation: Human Study 0

Approach A

- Present participants with two examples of same code (or similar implementation) in different styles.
- Participants rate the similarity of the two examples.

Approach B

- Present participants with three examples of code in different styles.
- Participants select whether the second or third is most similar to the first.

Evaluation: Human Study 0

- Compare similarity model's rating against human perceptions of similarity.
  - Two examples of same code (or similar implementations) in different typographical styles.
  - Participants rate how similar the examples are.
- Measure human-human and tool-human correlations.
